## MOUNTING PARTS FOR COPELAND SCROLL™ COMPRESSORS

Several different mounting assemblies are used with Copeland™ Scroll motor-compressors. The following information should be used as a guide in the application and installation of these mounting assemblies.

Compressors can be mounted either with rubber grommets or solid mounts. Consideration must however be given to sound attenuation and tubing reliability. Unlike a hermetic reciprocating compressor, the Scroll motor is pressed into the shell and not internally sprung. Some tubing geometry or “shock loop” may be required to reduce start-up vibration transferred from the compressor to external tubing (see Scroll application guidelines).

Scroll compressors can be originally delivered with different types of mountings or without mounting parts.

### 1 Bill of material

The 3 digits at the end of the compressor designation correspond to the Bill of Material (BOM).

The type of mounting parts delivered with the compressor will change the BOM number.

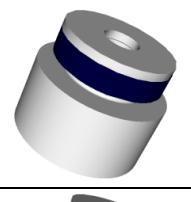

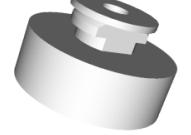

The table hereunder indicates which type of mounting part is delivered depending on the BOM number. This table is only valid for compressors manufactured in Europe.

	Mounting parts for single operation	Mounting parts for parallel operation	Without mounting parts

## 2 Mounting parts for single operation

### 2.1 Originally delivered with the compressors

Four vibration absorber grommets are supplied with each compressor. They dampen the start-up surge of the compressor and prevent sound and vibration from being transmitted to the compressor base during operation to a large extent. The metal sleeve inside is intended as a guide to hold the grommet in place. It is not designed as a load-bearing member, and excessive torquing can crush the sleeve. Its inner diameter is approximately 8.5 mm to fit, eg, an M8 screw. The mounting torque should be  $13 \pm 1$  Nm. It is critically important for the grommet not to be compressed.

## TECHNICAL INFORMATION

## 2.2 Optional for compressor originally delivered without mounting parts (BOM 422, 455, 477 ...)

The following compressors are originally delivered without mounting parts, so the same model can be used in a single or in a tandem application. Only the type of mounting part will differ depending on the type of application.

The following rubber grommets for single compressor applications are available on request.

Compressors	Id. number	Characteristics	Drawing
ZRD48KCE to ZRD81KCE ZRD125KCE	8000822 527-0116-00	Rubber 35-45 Durometer Height 19 mm	
ZP104KCE, ZP122KCE ZPD104KCE, ZPD122KCE	8848428 527-0221-00	Rubber 35-45 Durometer Height 19 mm

### 3 Mounting parts for Tandem / parallel operation

If the compressors are mounted on a Tandem or used in parallel, then the hard mountings (bolt M9 5/16") are recommended. The mounting torque should be  $27 \pm 1$  Nm. It is possible to deliver these hard mounting parts as a kit, or on request to deliver the compressor with these parts instead of the rubber grommets.

#### 3.1 Mounting parts between compressor and rails / frame or base plate

Compressors in Tandem applications should be hard-mounted to a common base to reduce stress on the tubing between the compressors. This reduces the chance of stress fractures and subsequent refrigerant leaks.

With smaller Copeland Scroll compressors, metal spacers are used between the compressor and the rails. The compressors are rigidly mounted by means of steel grommets onto two rigid rails/frame. The reason for the rigid mounting is to keep the stresses on the tubing between the compressors at reasonable levels.

### 3.3 Mounting parts between compressor / rails / ground

The 20 to 30 HP Scroll compressors use a new approach to secure the compressor to the rails. The base plates of the compressors have 4 holes which one uses to bolt the compressor to the tandem rails. No metal spacers are needed, which reduces the cost.

Compressors	Id. number	Characteristics	Drawing
ZB220KCE ZR250KCE to ZR380KCE ZP235KCE to ZP485KCE ZH100KCE to ZH150KCE	8040746 527-0178-00 Variation = 8049130	Rubber 60-70 Durometer	 

Rubber grommets are used to connect the Tandem assembly to the system base to isolate the system from any vibration.
