Rangeability

Rangeability is a measure of a valve's controllability. It is a measured property and is expressed as the ratio of a valve's maximum flow rate to its minimum controllable flow rate.

Application Notes

IMPORTANT

Valve sizing is important for correct system operation. Undersized valves do not have sufficient capacity at maximum load. Oversized valves do not have sufficient authority over the load in modulating applications.

Oversized valves can cause excessive cycling and the seat and ball can be damaged because of the restricted opening.

Proper Use

These valves are only for use in cold, warm, and hot water systems. Not suitable for oil, combustible gases, or steam. They are designed for a medium temperature range of from 35 to 250°F, at a maximum pressure of 360 psig VBN valves are to be operated with the appropriate Honeywell direct coupled actuators only.

Water should be properly filtered, treated and conditioned according to local conditions and the recommendations of the boiler or chiller manufacturers. The installation of a strainers and filters is recommended.

IMPORTANT

The presence of excessive iron oxide (red rust) in the system voids the valve warranty.

Required Operating Torque

Both Honeywell non-spring return MVN and spring return low torque direct coupled actuators can be utilized with the VBN2 and VBN3 valves. VB valves use a patented seat design that reduces the torque needed from the actuator.

Table 12. Close-off, Differential Pressure Ratings.

Valve Type	Valve Size (in.)	Close-off Pressure Rating (psid)
2-way	1/2, 3/4	130
	1, 1-1/4, 1-1/2, 2, 2-1/2, 3	100
3-way	1/2, 3/4, 1	50
	1-1/4, 1-1/2, 2, 2-1/2	40

NOTE: 3-way close-off ratings apply to 3-way valves with the B port plugged

Flow Characteristics, Fig. 8, 9

The VBN2 Two-Way Ball Valves have:

- an equal percentage flow characteristic with characterized flow control insert.
- a linear flow characteristic with full port balls.

The VBN3 Three-Way Ball Valves have:

- between ports A and AB: an equal percentage flow characteristic.
- between ports B and AB: a linear flow characteristic at 20% reduced C_v .

Fig. 8. Typical characterized VBN2 flow.

Fig. 9. Typical characterized VBN3 flow.

Fig. 10. Pressure derating curve.
The valve body is rated for WOG (water, oil, and gas), but the valve with its internal components are only rated for water and not for oil or gas.

Cavitation Limits

To prevent cavitation (the formation and collapse of steam bubbles), a conservative rule-of-thumb is to limit the pressure drop across the control valve to:

$$\Delta P < 1/2 \times (\text{absolute head pressure (psia)} - \text{water vapor pressure (psia)})$$

Water vapor pressure increases with fluid temperature, reducing the allowable pressure drop, but even chilled water can cavitate with sufficient pressure differential.

Typical pressure drop across a control valve is in the range of 3 to 5 psid. Two-position valves will typically show 0.5 psid pressure drop. Design coil flow should be limited by a balancing valve.
